Philosophical Reflections on Self-Ecoorganizing Human Management: An Experiential Overview of Liberating Training from Qualitative Transformation

ABSTRACT

This research revolved around Exploring Philosophical Reflections on Self-Ecoorganizing Human Management: An Experiential Panoramic of Liberating Training from Qualitative Transformation, for which it was based on The philosophical foundations of Deep Ecology, Systemic Thinking, Environmental Ethics, ecological humanism. These philosophical foundations provide a solid foundation for Self-Ecoorganizing Human Management. The methodology used was documentary with a bibliographic approach, for which a wide range of bibliographic sources relevant to the research topic was identified. This involved using academic databases, libraries, online repositories, catalogs, and other specialized sources to locate relevant documents. Once the documents were compiled, their content was evaluated and analyzed. Techniques such as summary, content analysis and synthesis were used to organize and understand the information contained in the documents. This facilitated the subsequent comparative analysis and the identification of patterns, divergences or convergences in the points of view and perspectives present in the documents. The results highlight that the Self-Ecoorganizing Human Management invites to consider the notion of coevolution between the human being and the environment. As we self-regulate and organize ourselves in harmony with natural systems, positive feedback is generated that drives both our own evolution and that of the environment in which we live. This dynamic interaction between humans and natural systems gives us the opportunity to co-create a sustainable and balanced future. It is concluded that: Self-Ecoorganizing Human Management offers us an enriching perspective that transcends the conventional limits of management and invites us to explore new ways of living, learning and coexisting in this world.
